# Disclaimer

This session is intended for educational purposes only.

Please be aware that:

- All activities demonstrated during this session are conducted in a controlled environment with explicit permission.
- Unauthorized access to computer systems is illegal and unethical.
- Ensure that your actions comply with all applicable laws and regulations.
- The information shared should be used to improve your own security posture and not for malicious purposes.
- By participating in this session, you agree to abide by these principles and use the knowledge gained responsibly.

PS: I am a student learning about this also so... feel free to correct any mistakes I make!

# **What is PWN?**

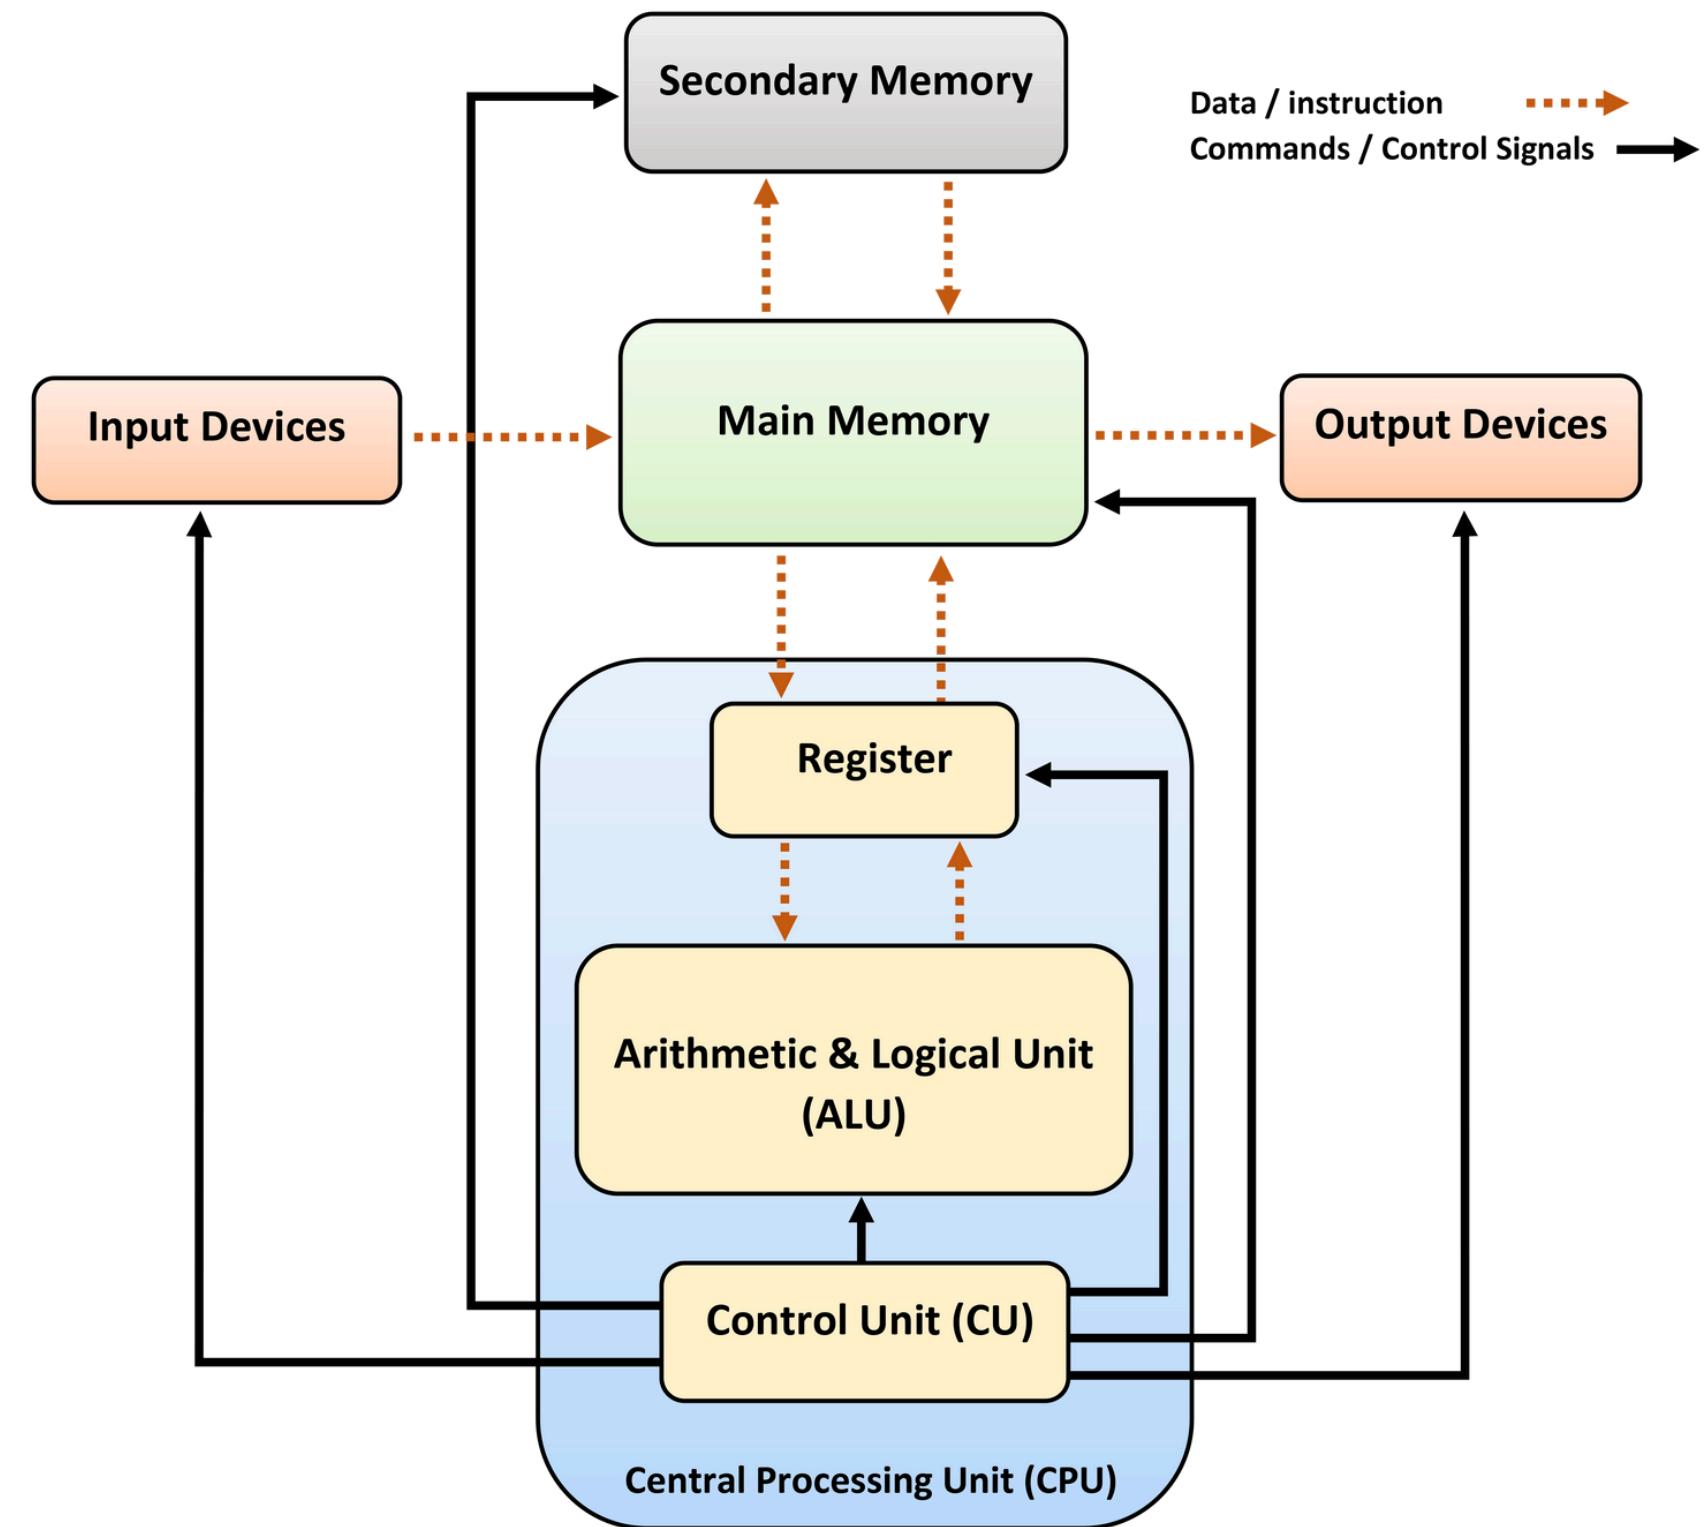

# What is PWN?

- PWN = “own”
- Finding a vulnerability in a compiled program
- Using that vulnerability to control the program’s behavior

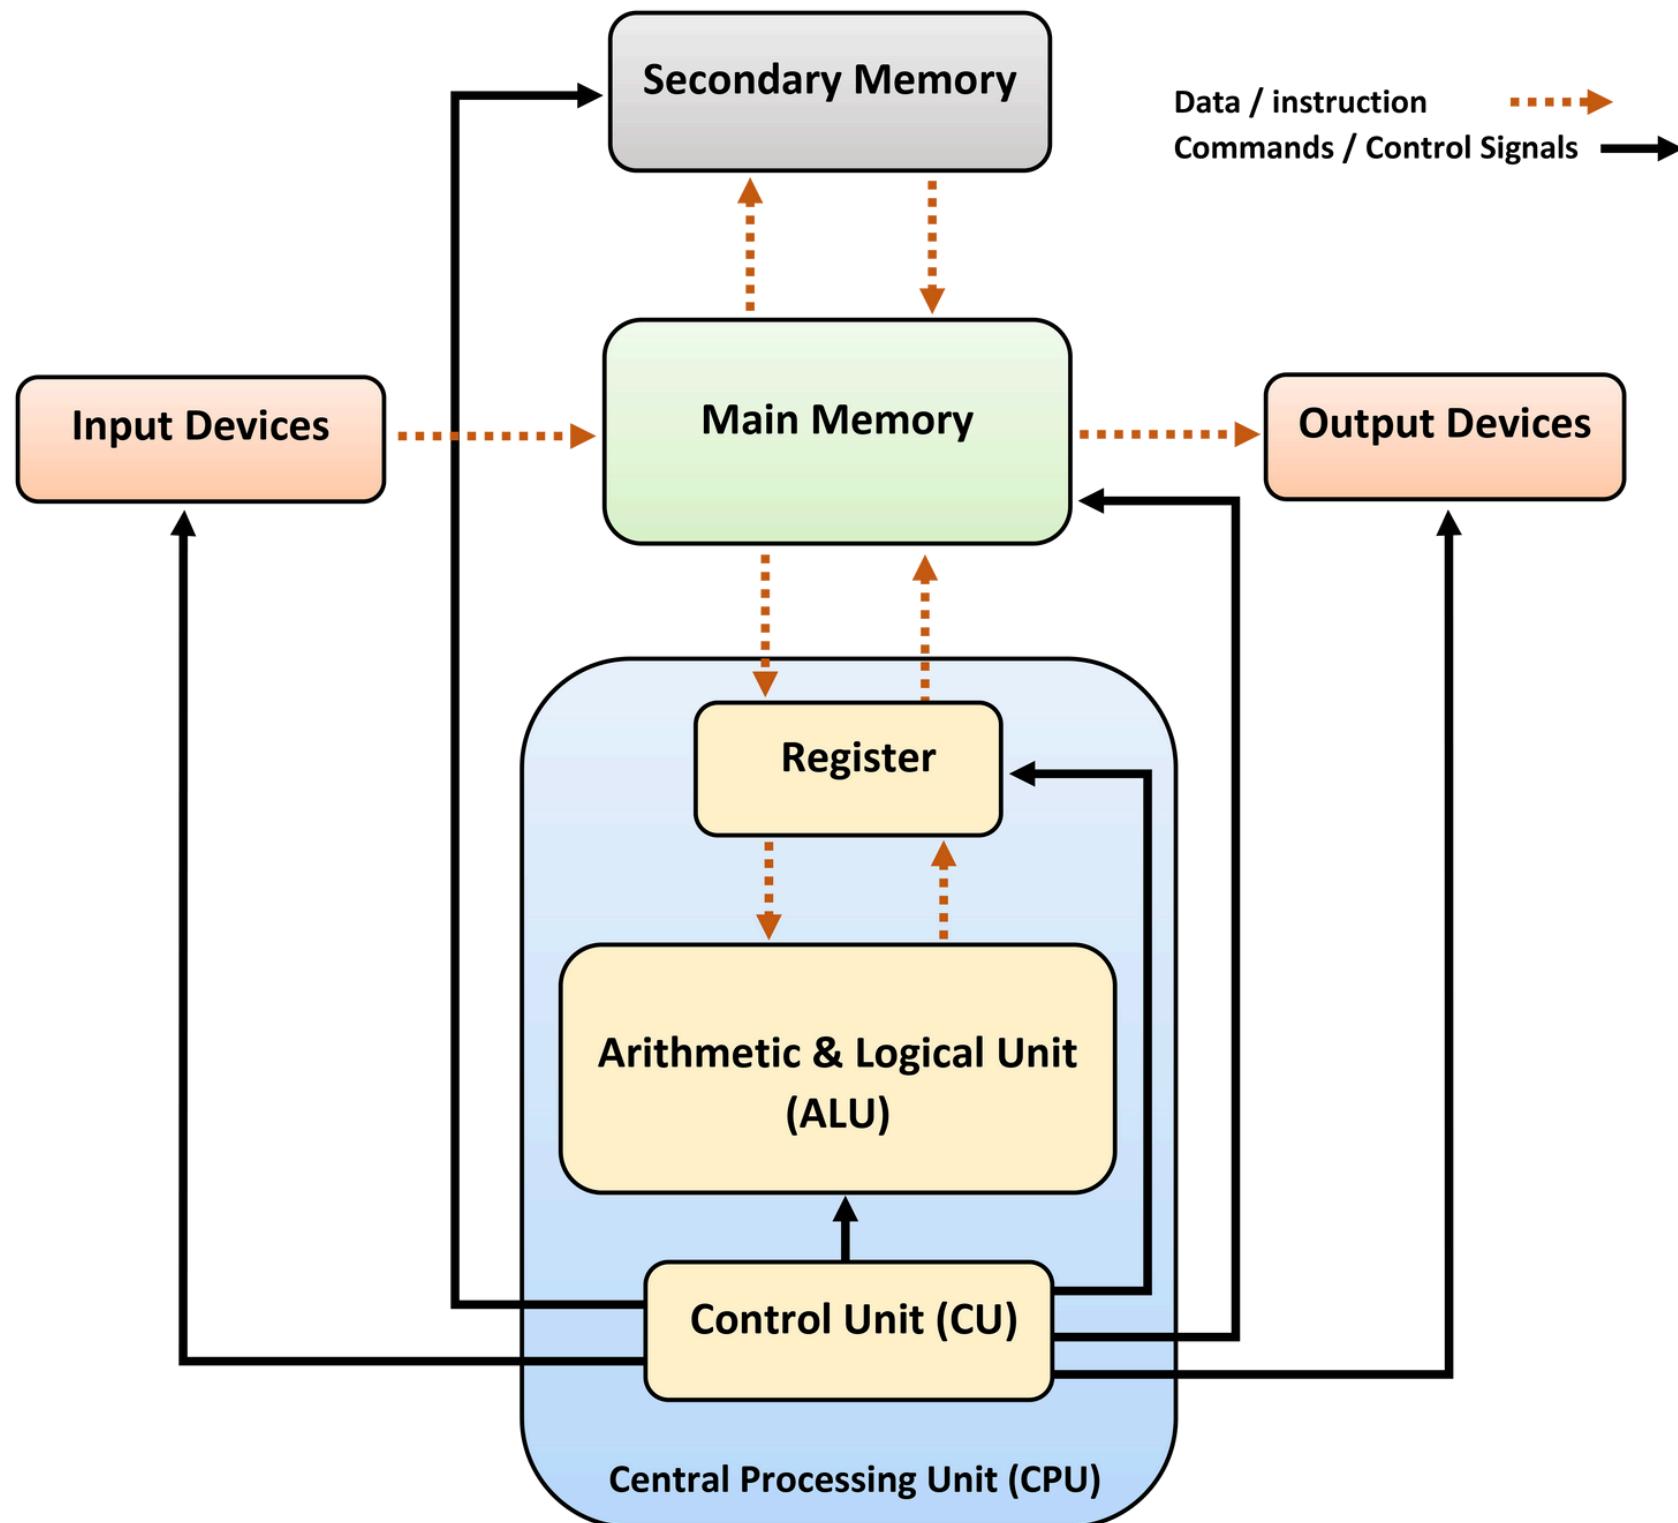

reading code → to crashing a program → run our own commands

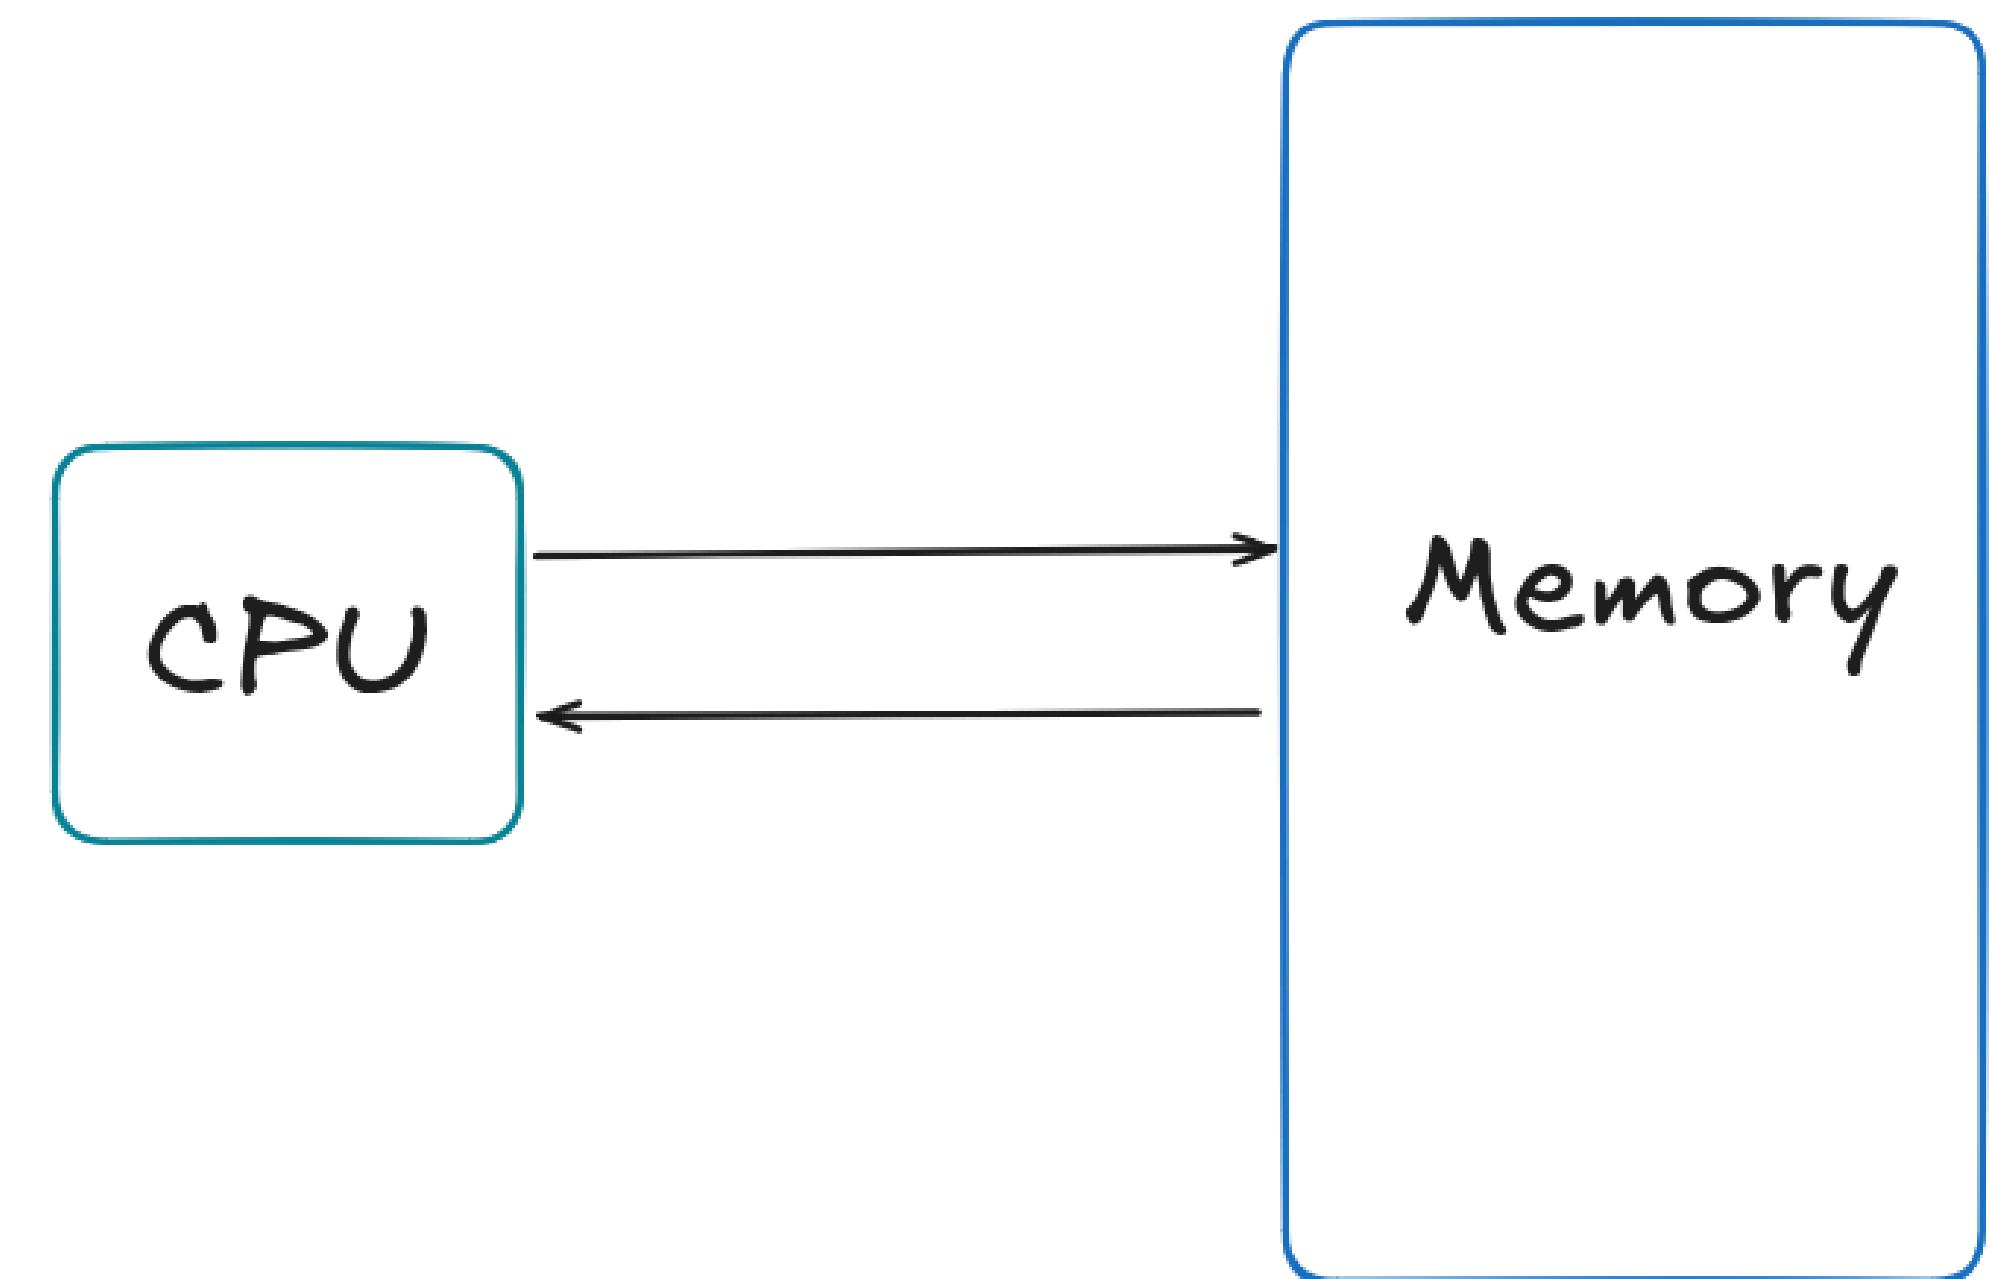

# **Experience doing PWN**

# **Overview of Computer Architecture for Binary Exploitation**

# Von Neumann

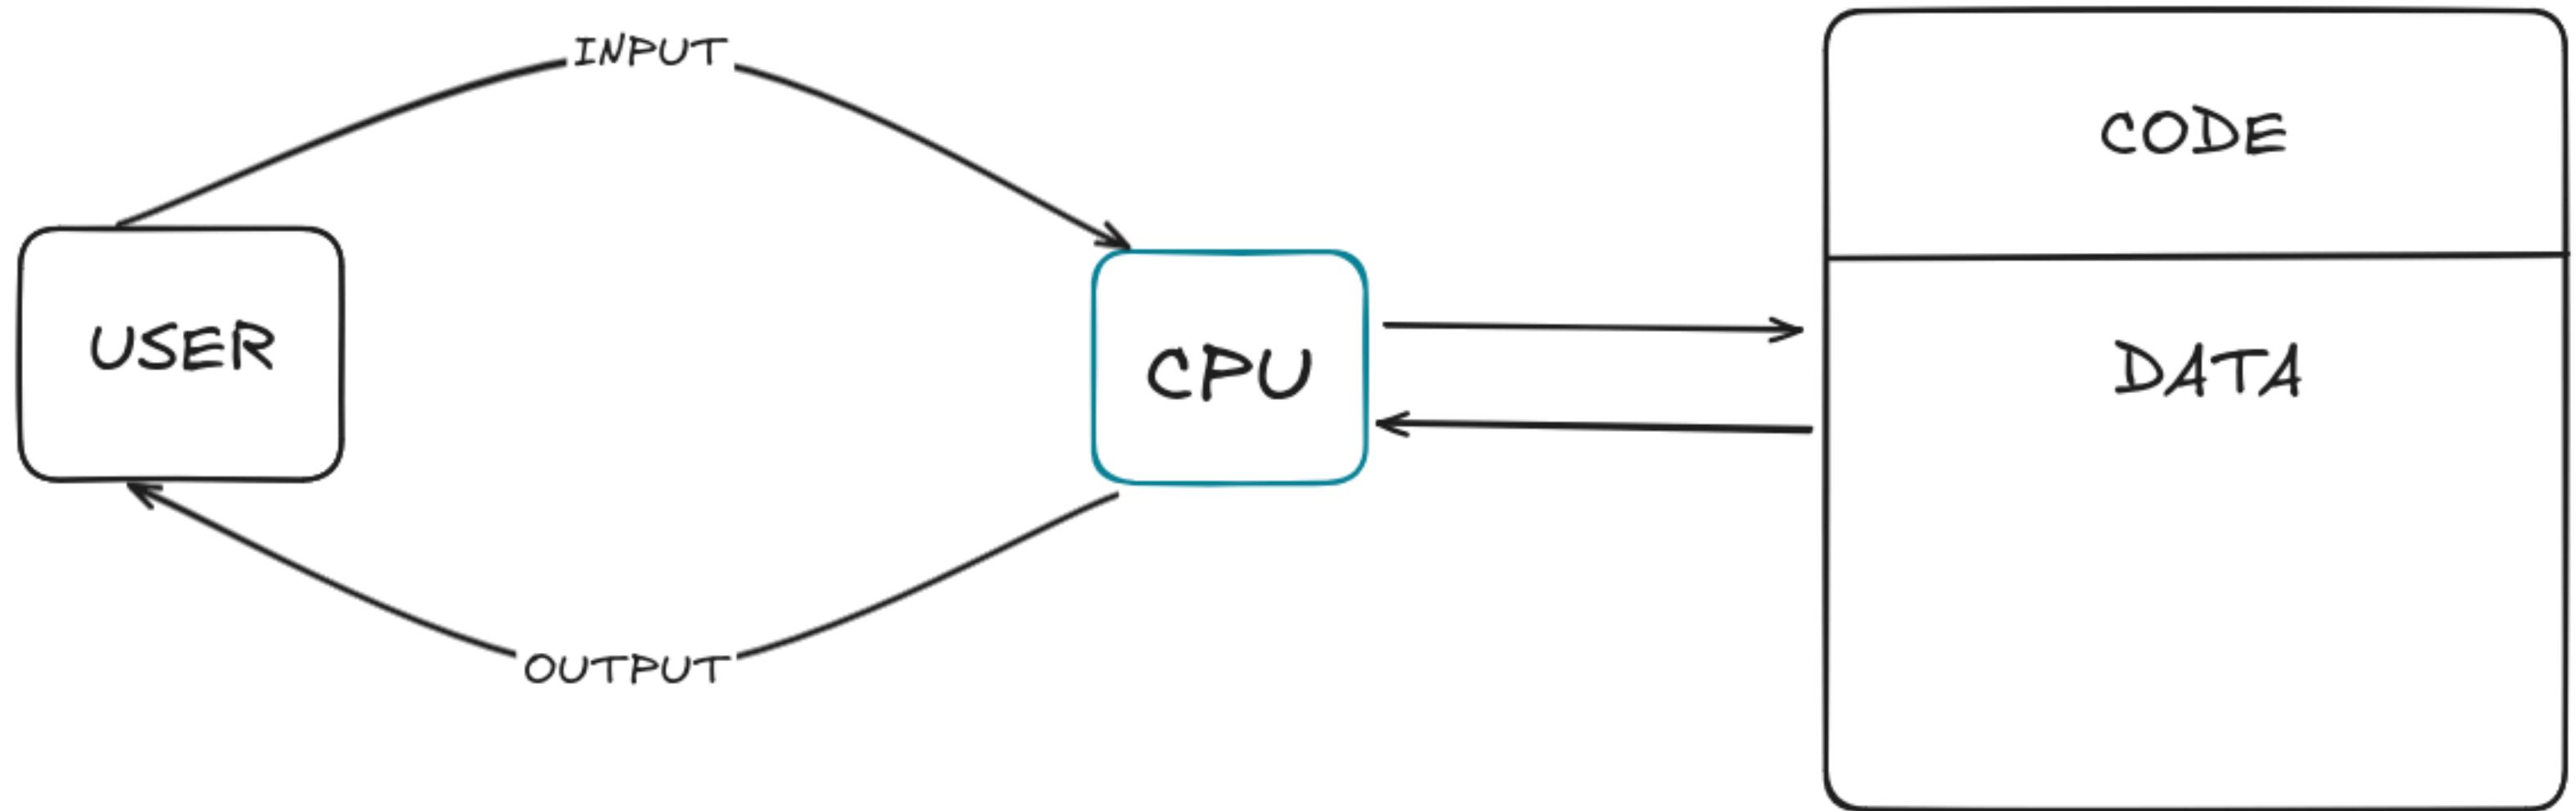

Memory

CODE

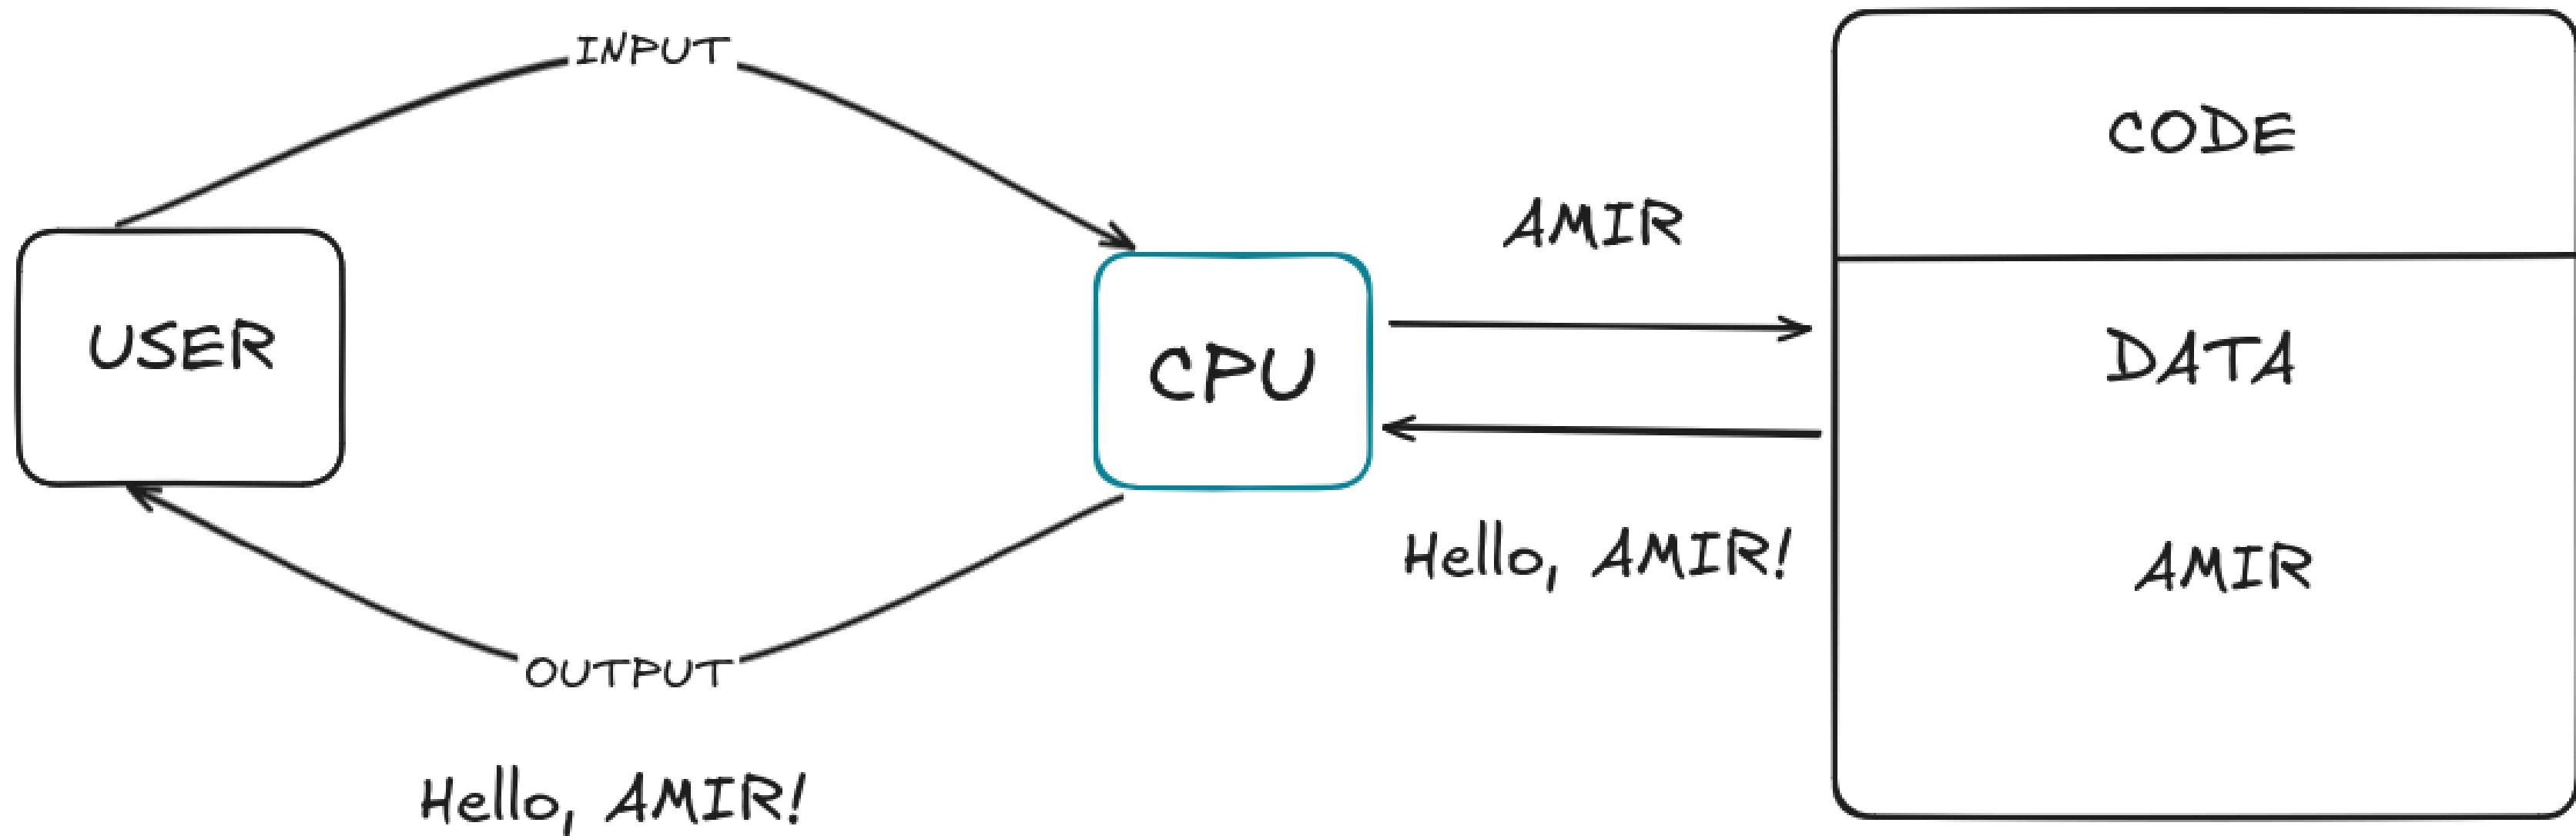

DATA

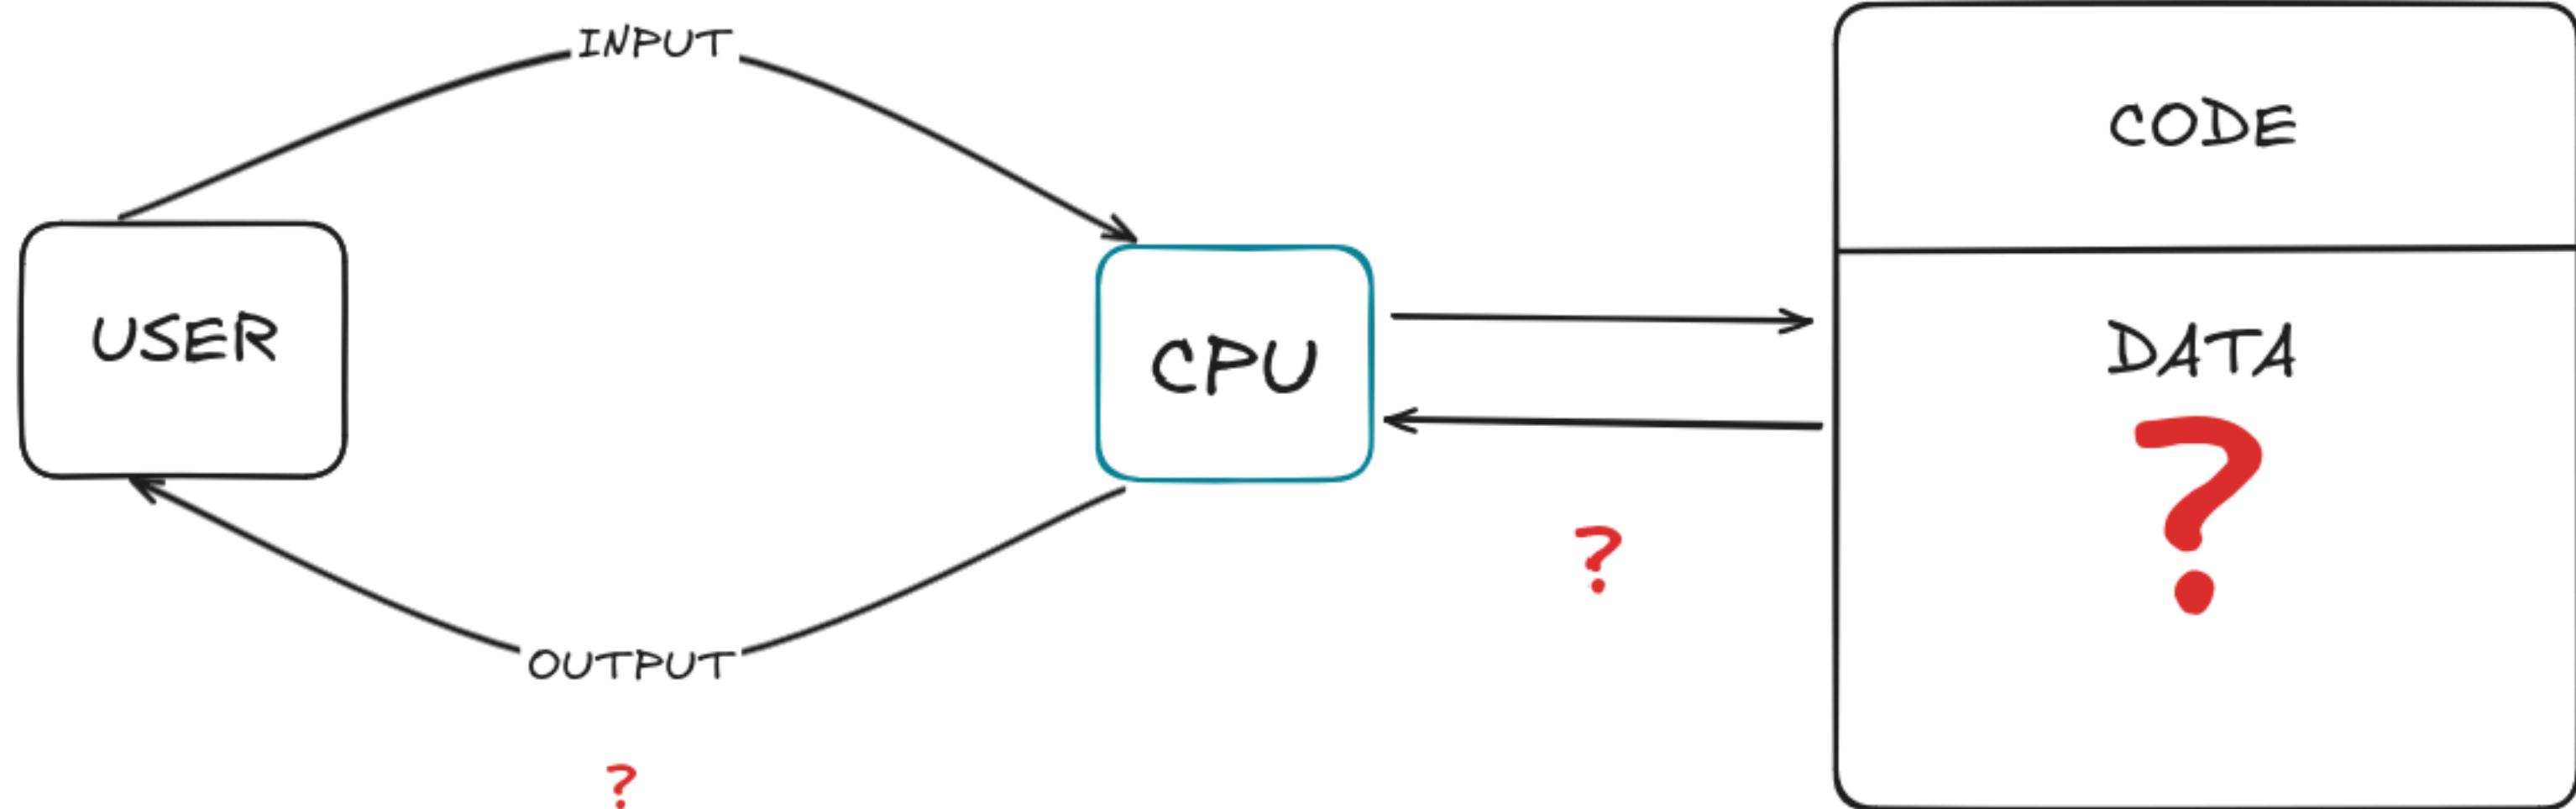

```
14 #include <stdio.h>
13
12 int main() {
11     char name[100];
10
9     printf("Enter your name: ");
8     // Read name
7     gets(name, sizeof(name), stdin);
6
5     printf("Hello, %s!\n", name);
4
3     return 0;
2 }
1
```

AMIR

```
14 #include <stdio.h>
13
12 int main() {
11     char name[100];
10
9     printf("Enter your name: ");
8     // Read name
7     gets(name, sizeof(name), stdin);
6
5     printf("Hello, %s!\n", name);
4
3     return 0;
2 }
1
```

```
14 #include <stdio.h>
13
12 int main() {
11     char name[100];
10
9     printf("Enter your name: ");
8     // Read name
7     gets(name, sizeof(name), stdin);
6
5     printf("Hello, %s!\n", name);
4
3     return 0;
2 }
1
```

# The Goal of this Session

- Basics on Low Level Computer Knowledge
- Basics on PWN
  - Understand Buffer Overflow
  - Understand Return Oriented Programming

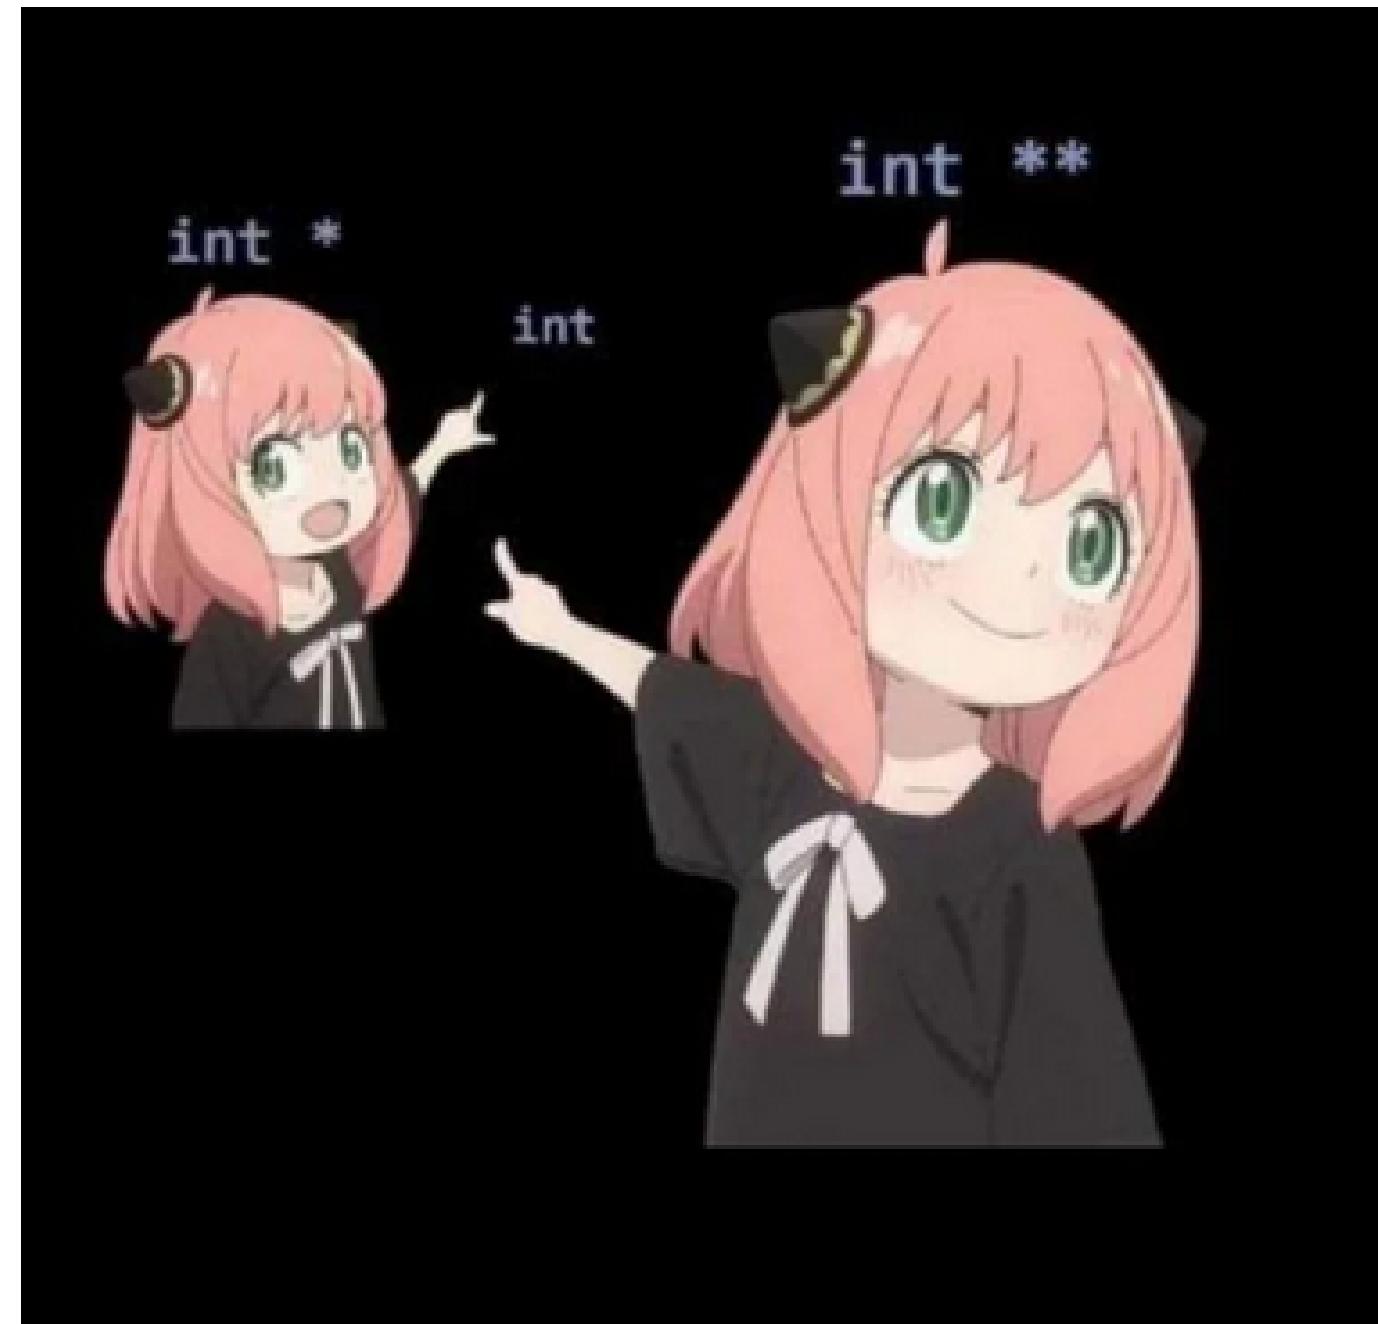

# Pointers

# What is Pointers?

- A pointer stores a memory address
- It "points to" a location in memory
- Not the data, just the address

# What is Pointers?

- A pointer stores a memory address
- It "points to" a location in memory
- Not the data, just the address

# What is Pointers?

- A pointer stores a memory address
- It "points to" a location in memory
- Not the data, just the address

# What is Pointers?

```
int x = 20;
```

```
int *p = &x;
```

# What is Pointers?

```
int x = 20;
```

```
int *p = &x;
```

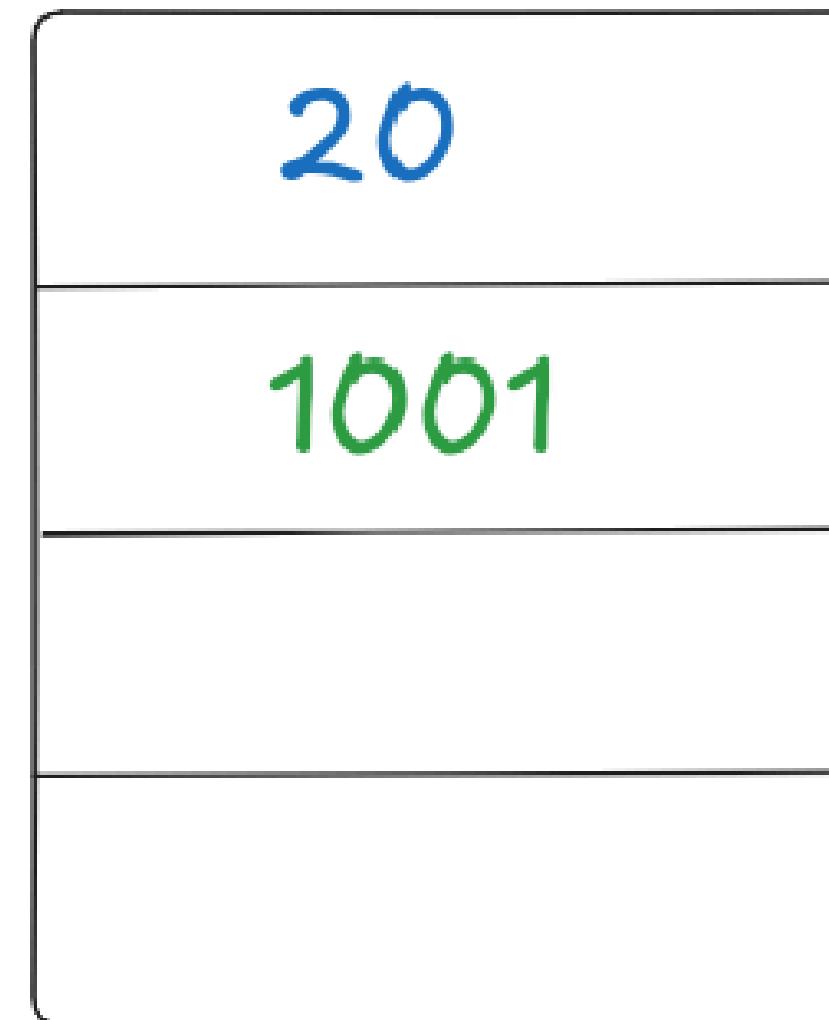

address      data

12
13    return;
14 }
15
```

```
x: 20
&x: 0x7ffffbd64a0bc
p: 0x7ffffbd64a0bc
```

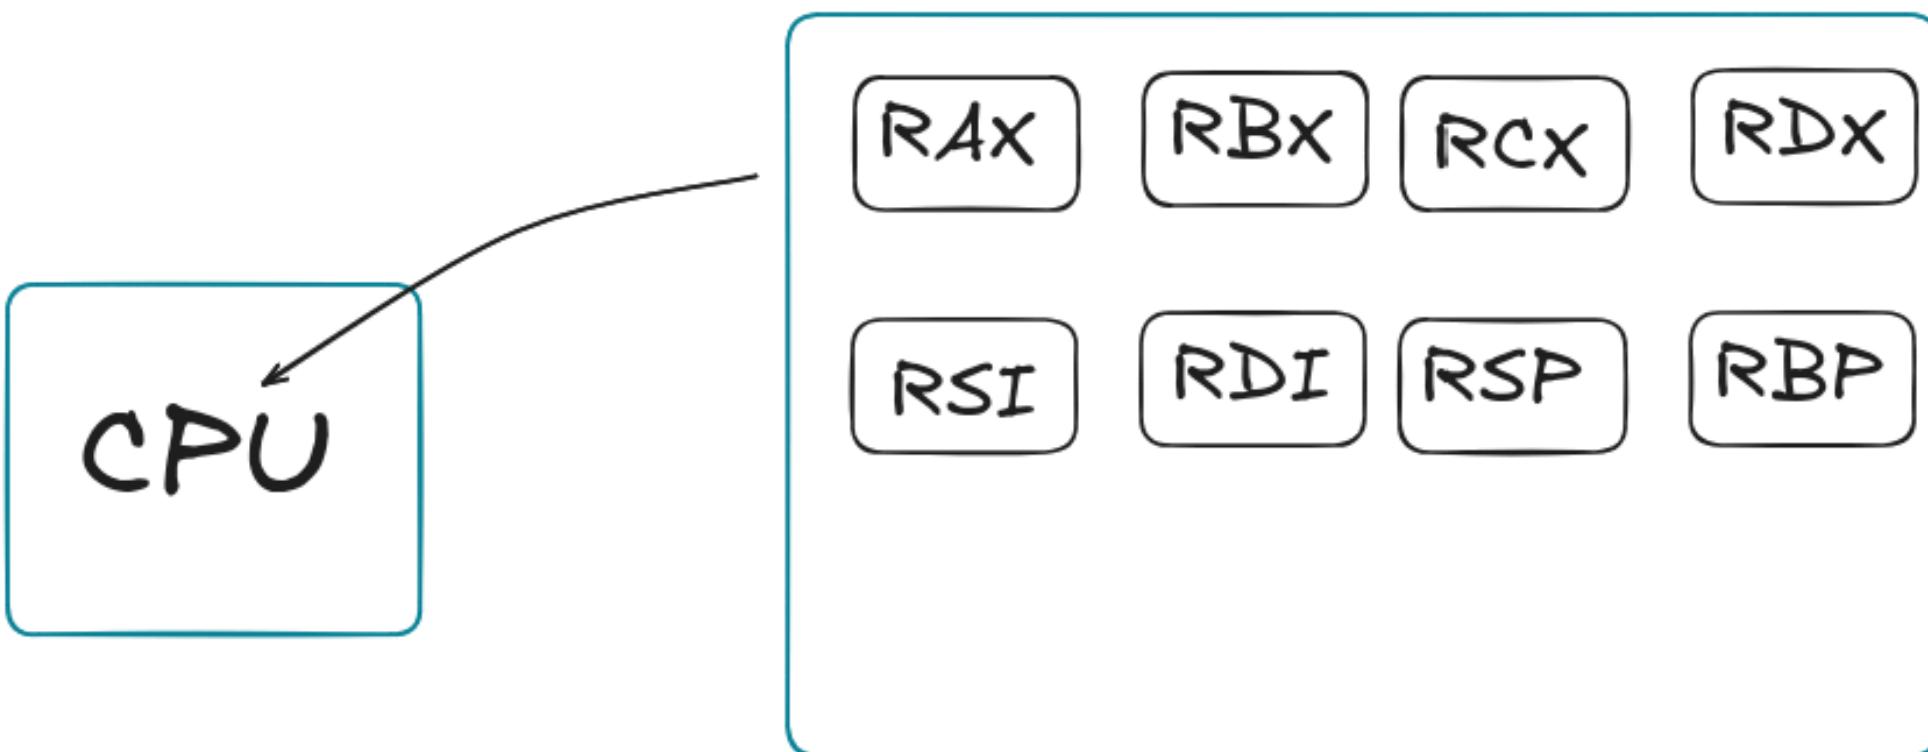

# Registers and the CPU

# What are Registers?

- Ultra-fast storage built inside the CPU
- Used for temporary data, addresses, control
- Directly manipulated during program execution

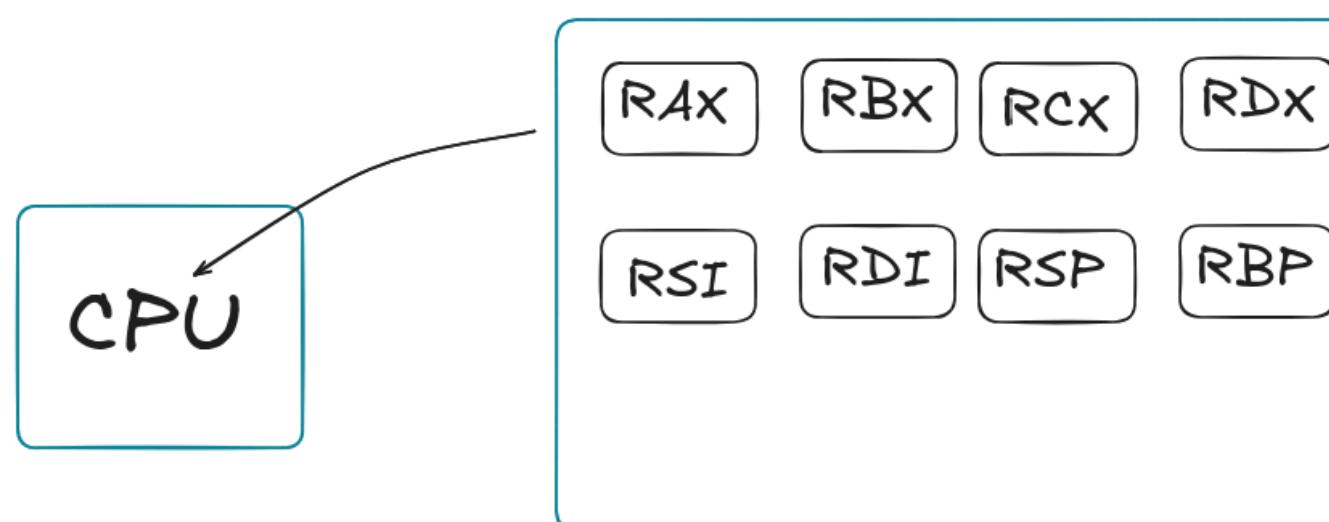

# What are Registers?

- Ultra-fast storage built inside the CPU
- Used for temporary data, addresses, control
- Directly manipulated during program execution

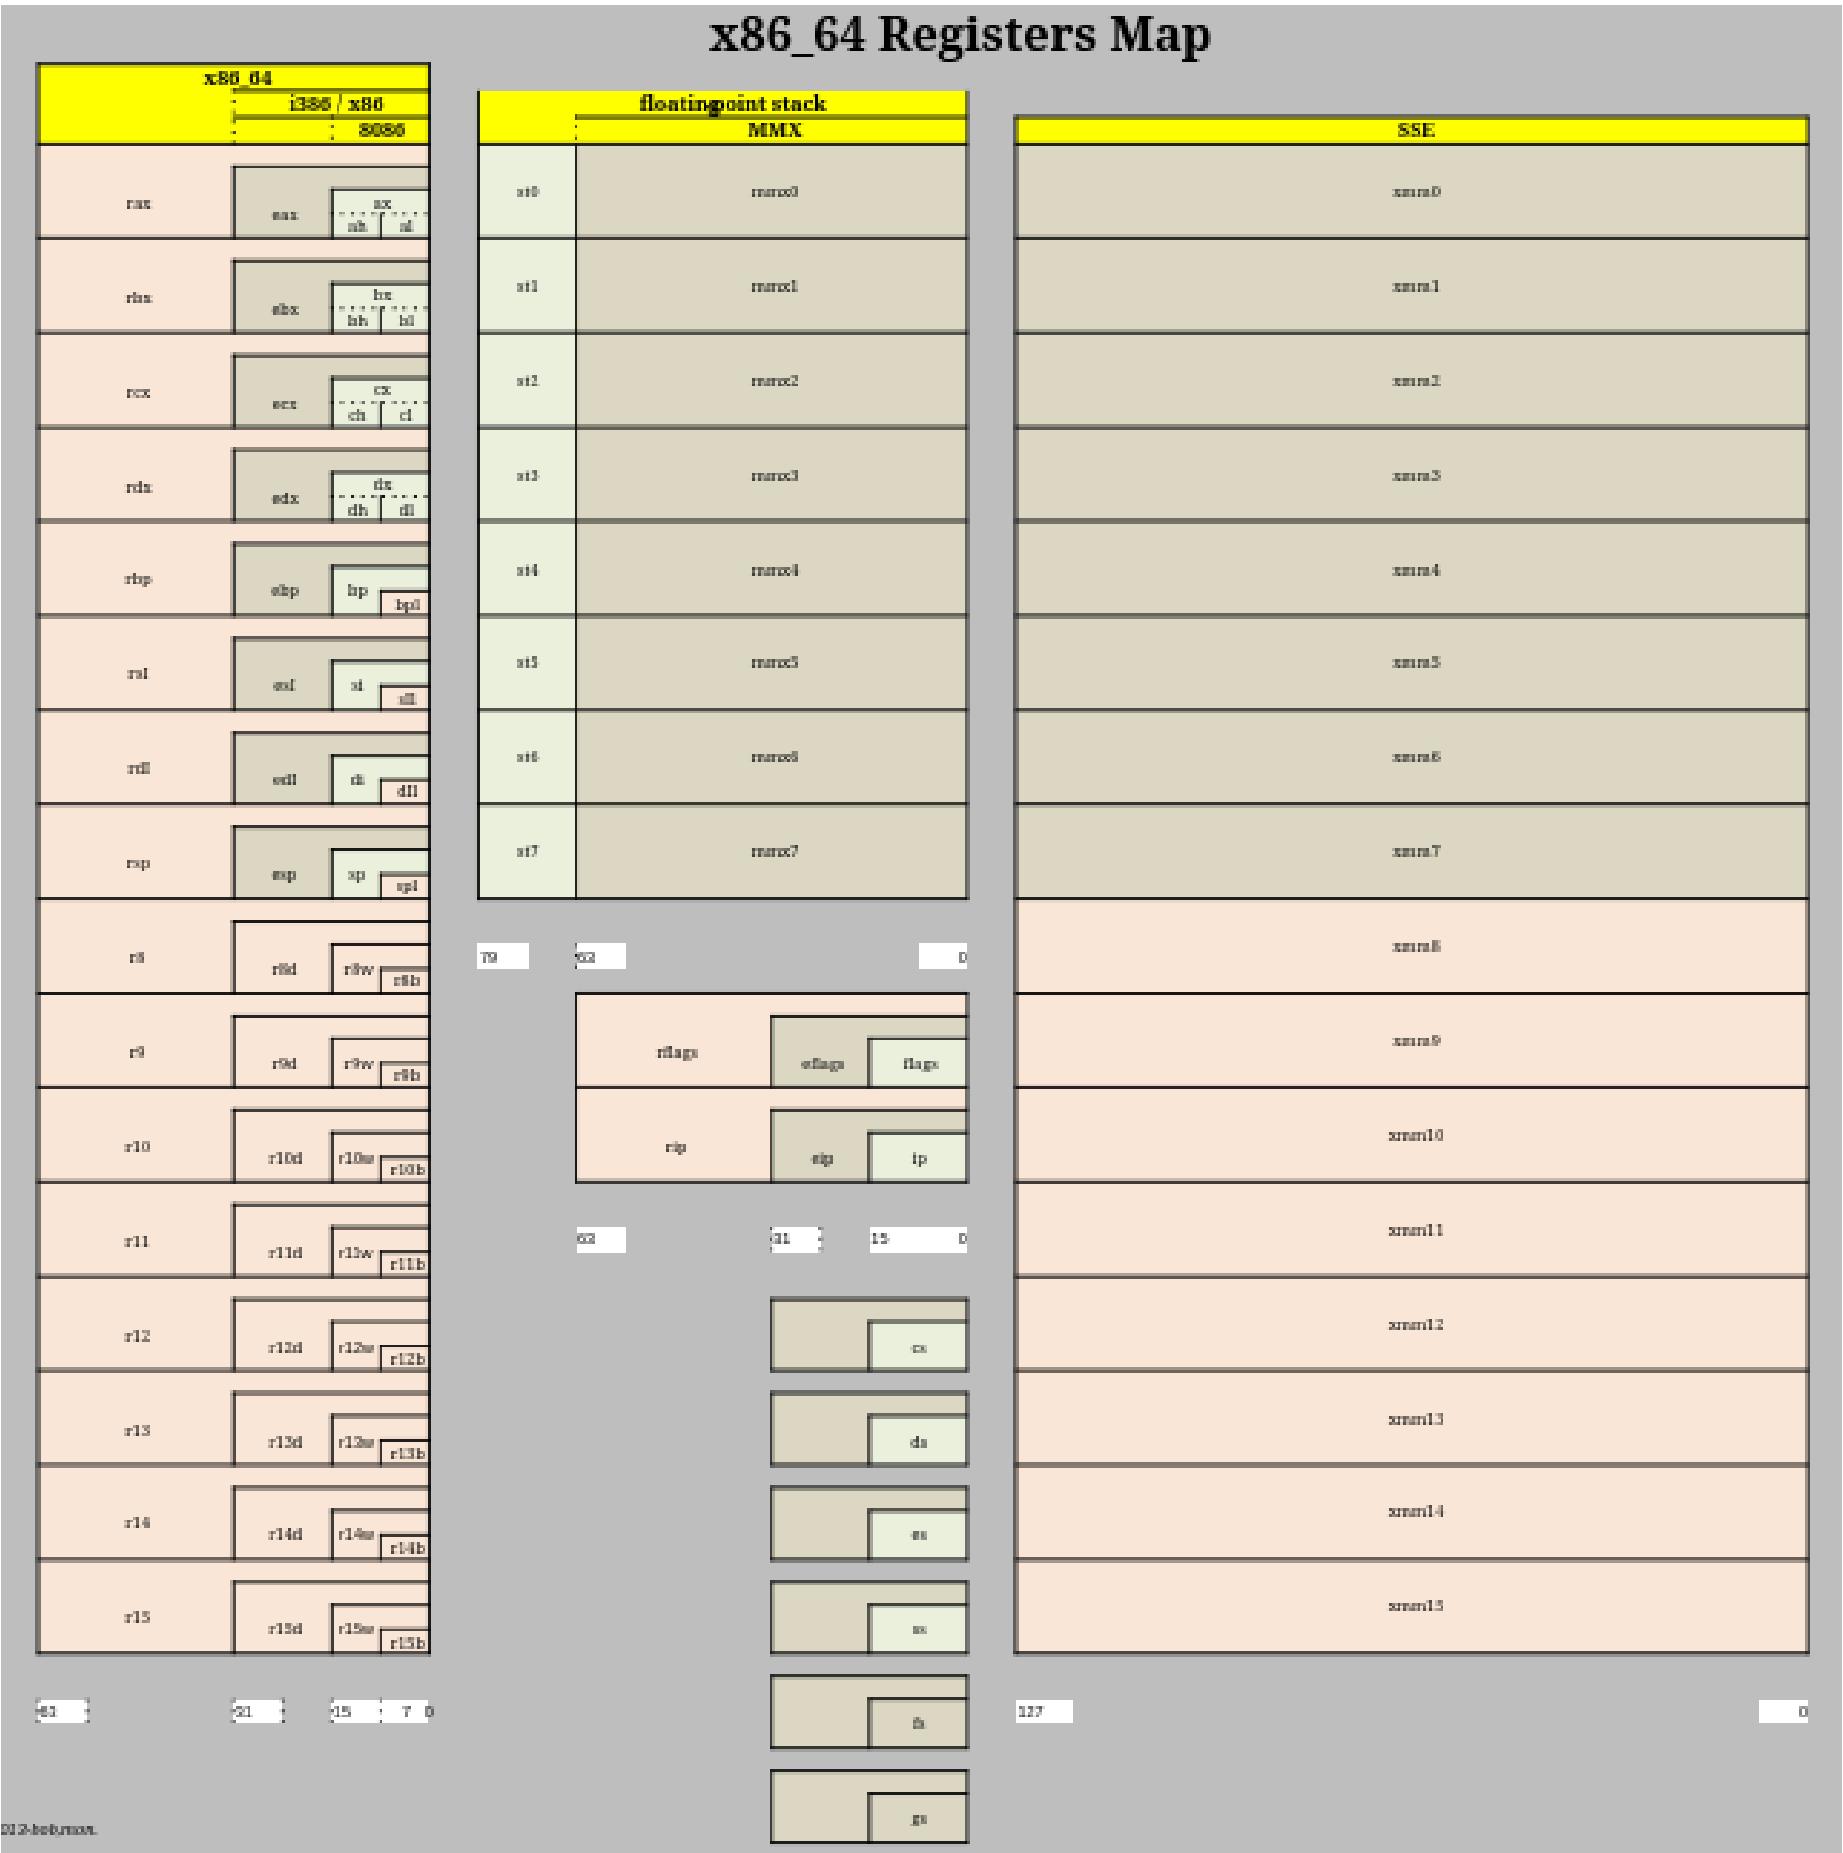

# What are Registers?

- Ultra-fast storage built inside the CPU
- Used for temporary data, addresses, control
- Directly manipulated during program execution

| q (8 bytes) | 1 (4 bytes) | w (2 bytes) | b (1 byte) |                   |
|-------------|-------------|-------------|------------|-------------------|
| %rax        | %eax        |             | %ax        | accumulate        |
| %rbx        | %ebx        |             | %bx        | base              |
| %rcx        | %ecx        |             | %cx        | counter           |
| %rdx        | %edx        |             | %dx        | data              |

| %rbp        | %ebp        |             | %bp        | base pointer      |

## x86\_64 Registers Map

source: [https://upload.wikimedia.org/wikipedia/commons/3/3e/X86\\_64-registers.svg](https://upload.wikimedia.org/wikipedia/commons/3/3e/X86_64-registers.svg)

# Key Registers to take note

- **RSP and RBP:** Manages the **STACK**
- **RIP:** Keeps track of functions called/returned
- **RDI, RSI, RDX:** Function parameters

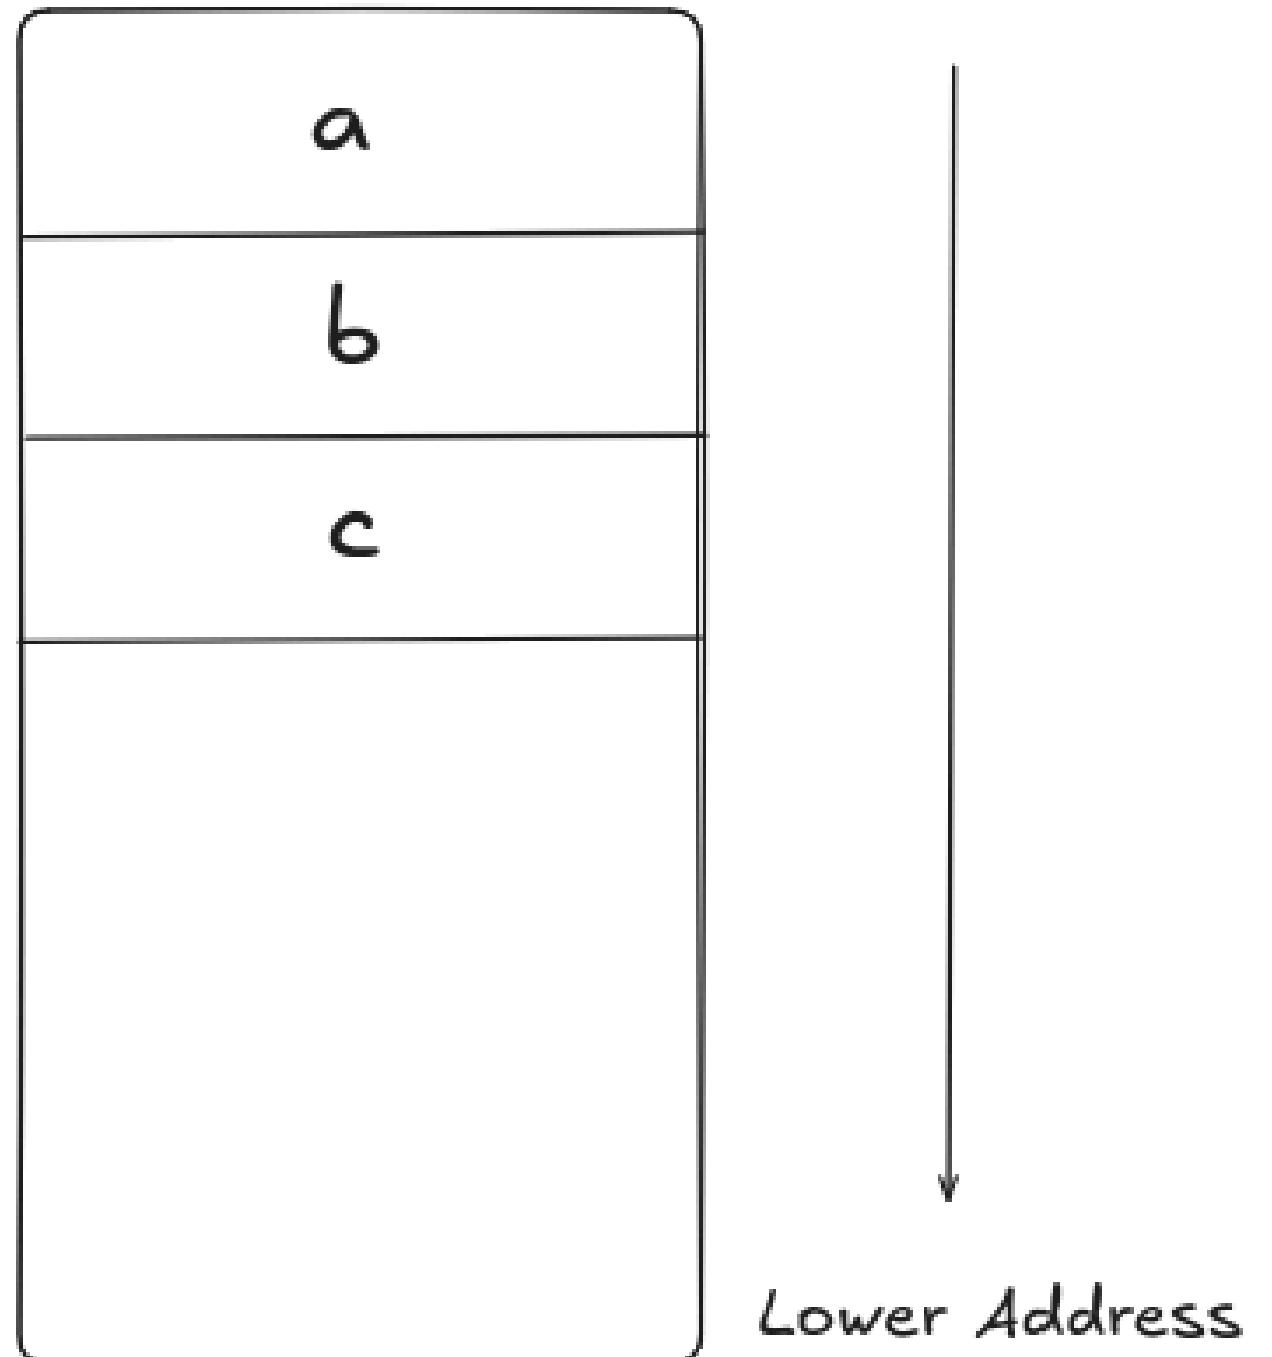

# The STACK and Function Calling

# What is the Stack?

- One of the “region” of memory for function execution
- Used to store:
  - Function arguments
  - Return addresses
  - Local variables
- Grows downward in memory (from high to low addresses)

# What is the Stack?

- One of the “region” of memory for function execution
- Used to store:
  - Function arguments
  - Return addresses
  - Local variables
- Grows downward in memory (from high to low addresses)

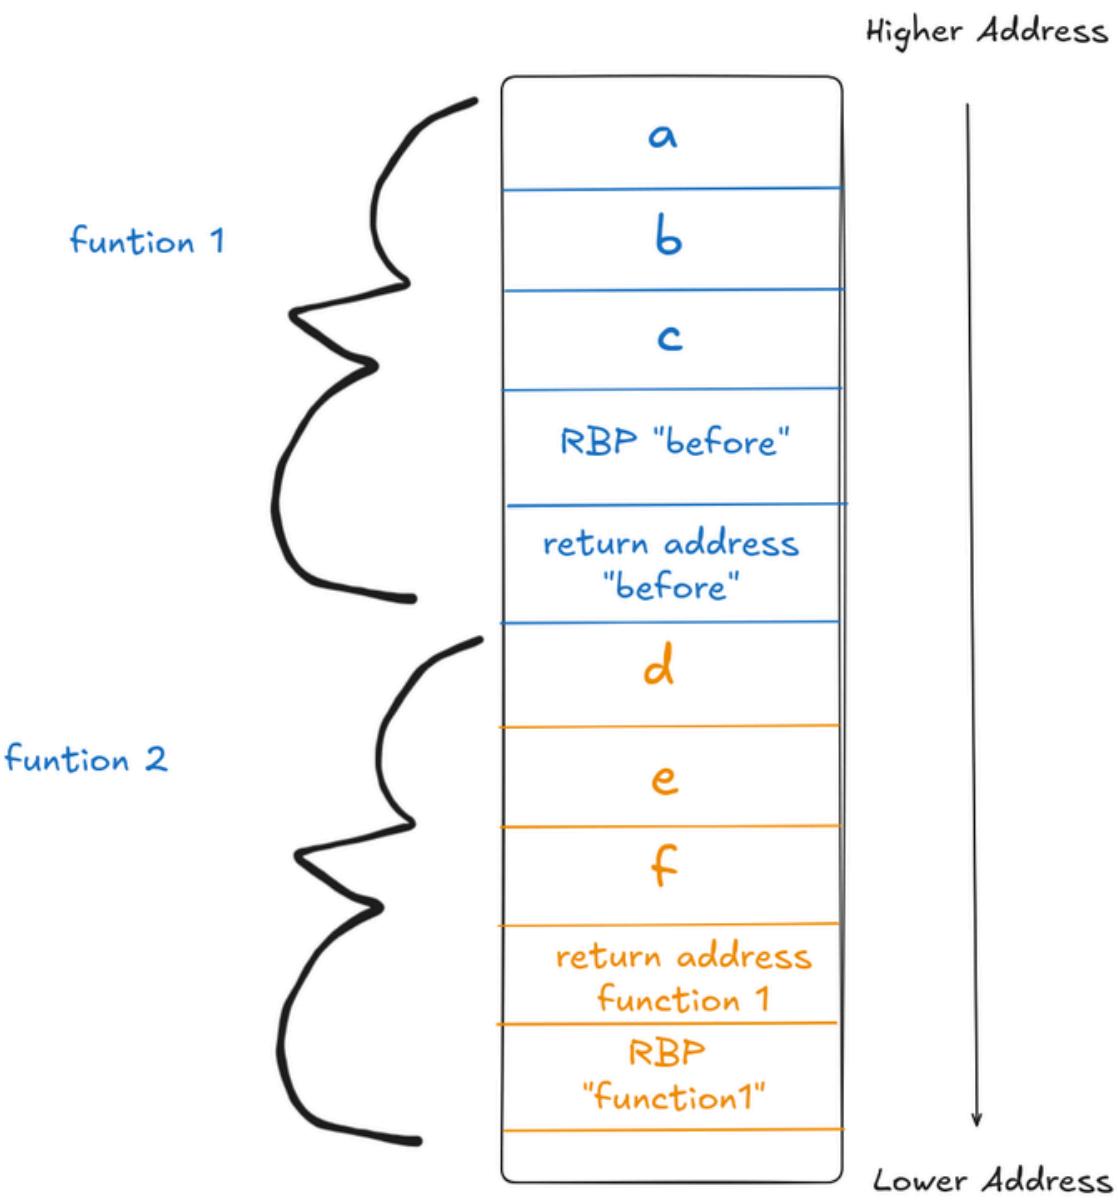

# What is the Stack?

```
1 #include <stdio.h>
1 void function2(){
2     int d = 400;
3     int e = 500;
4     int f = 600;
5
6
7     return;
8 }
9
10
11
12 void function1(){
13     int a = 10;
14     int b = 20;
15     int c = 30;
16
17     function2();
18     return;
19
20 }
```

# What is the Stack?

```
1 #include <stdio.h>
1 void function2(){
2     int d = 400;
3     int e = 500;
4     int f = 600;
5
6     return;
7 }
8 }

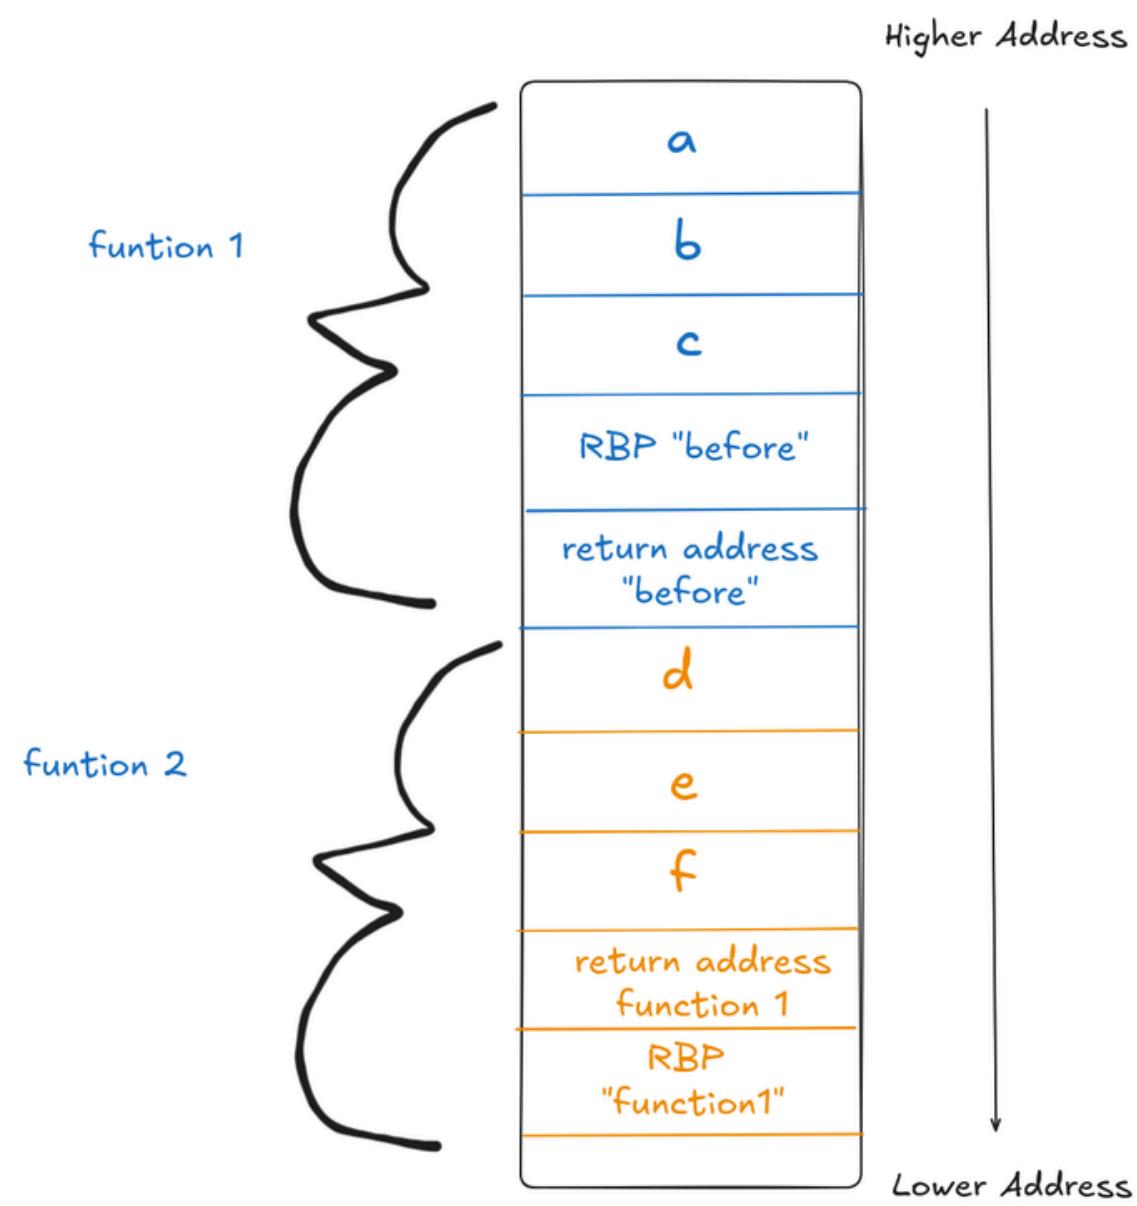

12 void function1(){
13     int a = 10;
14     int b = 20;
15     int c = 30;
16
17     function2();
18     return;
19 }
20 }
```

# How does the program tracks the size?

```
1 #include <stdio.h>
1 void function2(){
2     int d = 400;
3     int e = 500;
4     int f = 600;
5
6     return;
7 }
8 }

## “gadgets”

A **gadget** is a **small sequence of machine instructions/asm code** that already exists somewhere in the binary, usually ending with a “**ret**”.

In exploitation, we weaponize these gadgets together to perform actions we want.

Can use **ROPgadget/objdump**  
to find these gadgets

```
0x00000000004011fd : pop rbp ; ret
0x0000000000401353 : pop rdi ; ret
0x0000000000401357 : pop rdx ; ret
0x0000000000401355 : pop rsi ; ret
0x0000000000401188 : push -0xffbf0 ; loopne 0x4011f5 ; nop ; ret
0x000000000040134f : push rbp ; mov rbp, rsp ; pop rdi ; ret
0x000000000040101a : ret
0x0000000000401011 : sal byte ptr [rdx + rax - 1], 0xd0 ; add rsp, 8 ; ret
0x000000000040105b : sar edi, 0xff ; call qword ptr [rax - 0x5e1f00d]
